Leaders

Scoring tables are as played. Adjusted tables account for the opponent, so ten points conceded to a strong offence outranks a shutout of a weak one — the two disagree on purpose.

Season Projection

120 simulated seasons, each playing every remaining game and refitting ratings weekly, seeded with the 760 results already in hand. This run does not record which week those results run through. Outcomes are sampled rather than awarded to the favourite, so upsets happen at the rate the model believes they happen. The mean rating comes back close to where the season has already put each team — a simulation learns nothing new about games nobody has played — so the 10th–90th band, not the mean, is the forecast, and it widens the further out the projection runs.

Power ratings are opponent-adjusted and fitted separately by classification, so a team is measured against the level it actually plays. Confidence figures are probabilities, not guarantees — a 70% pick is expected to lose roughly three times in ten. Games shown in **red** are near coin-flips.
